AN 1996-030511 [03] WPIDS

CR 1995-090608 [12]

AB WO 9532980 A UPAB: 20040418

Method for solution phase preparation of an oligonucleotide (ON) of formula (I),

comprising reaction of an ON minus 1 synthon of formula (II) with a mono-unit phosphite synthon of formula (III) is new.

Q = O, S, CH2, CHF or CF2; Bx = a nucleosidic base; X = OH, SH, SMe, F, OCN, O(CH2)mNH2, O(CH2)mMe, opt. substd. 1-10C alkyl, alkaryl, aralkyl, Cl, Br, CN, CF3, OCF3, alkoxy, alkylthio, alkylamino, alkenoxy, alkenylthio or alkenylamino, SOMe, SO2Me, ONO2, NO2, N3, amino, heterocycloalkyl, heterocycloalkaryl, aminoalkylamino, polyalkylamino, substd. silyl, an RNA cleaving gp., reporter gp., a conjugate, an intercalator, or a gp. for improving the pharmacodynamic or pharmacokinetic properties of an ON; m = 1-10; W = a 3' hydroxyl protecting gp.; Z = O or S; T = a phosphorus blocking gp.; Y = a 5' hydroxyl protecting gp.; U = a phosphite activating gp.; and n = 0-50.

Also new are: (A) the process as above, further comprising removal of gps. W,T, and Y from (I) and oxidation of the (I) to form phosphorothioate or phosphodiester inter-nucleoside bonds; (B) as (A), but further comprising transforming (I) into a synthon of type (II) for reaction with another synthon of type (III); (C) libraries comprising a number of the above cpds.

USE - ON's have well-known uses for diagnostic, therapeutic, research and other purposes in biotechnology and medicine. The subject matter of the patent is concerned solely with preparative methods. The ON can be synthesised either singly, or as a number to form, e.g. a library, by using a number of synthons in the reaction.

ADVANTAGE - As a solution method, the method avoids the disadvantages of solid supports, i.e. fragility and limited activated surface, resulting in limited anchoring of strands. The **silylalkoxy** gp. avoids the expense of the cyanoethyl analogue and problems resulting from subsequent fission of acrylonitrile, i.e. carcinogenicity and reactivity, e.g. by Michael reaction, to form unwanted by-prods. The method appears amenable to scale-up. Large excess of condensing base, usually a tetrazole derivative, is not needed.

Dwg.0/3

ABEQ US 5571902 A UPAB: 19961211

A method for the solution phase preparation of an oligonucleotide comprising reacting, in solution, a first synthon having the structure (I) with a second synthon having the structure (II) to form a moiety having the structure (III) where each Q is independently O or S; each Bx is independently a nucleosidic base; each X is independently, H, OH, F, O-alkyl, S-alkyl, N-alkyl, O-alkenyl, S-alkenyl or N-alkenyl; each Y is independently a 5' hydroxyl protecting group; W is a 3' hydroxyl protecting group; each Z is independently O or S; each T is independently -O-(CH2)xSiR3R4R5; R3, R4 and R5 are each independently alkyl or aryl; U is a phosphite activating group; n is an integer from 0 to 50; and x is 1 to about 7.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.
AB Class of high performance thermosetting materials composed of polyarylene polyether resins having each of their ends capped with a monovalent unsaturated organo radical. The end-capped polyarylene polyether resins have the formula:

Z--polyarylene polyether chain--Z'

wherein Z and Z' are each a monovalent unsaturated organo radical. Usually Z and Z' are alkylene, aralkylene or cycloalkylene moieties. The end-capped polyarylene polyethers can be cured as is or in the presence of one or more unsaturatd comonomers to afford homopolymers or copolymers, respectively. Such cured systems exhibit high glass transition temperatures, good tensile properties, excellent electric and alkali resistance and improved stress cracking resistance. End-terminated polysulfone resins having molecular weight of 5,000 to 15,000 are especially advantageous. The properties exhibited by the vinyl/allyl terminated oligomers are useful in fields which require high temperature performance, excellent solvent resistance and good fabrication characteristics. Specific areas of application include high performance molded products for appliances and electronics, high temperature laminates and adhesives and protective and insulative coatings.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.
